13

14

## 11 Scope

2The present document describes the architecture for charging and billing for IMS services.

3For the purpose of the present document, the charging data is considered to be generated and collected by  
4charging functions in the network elements.

5The objectives of the present document are:

- 6 - to describe principles of charging in an IMS network;
- 7 - to provide a description of the charging architecture; and
- 8 - to provide the descriptions of events and triggers for the generation of charging data.

## 92 References

10The following documents contain provisions which, through reference in this text, constitute provisions of the  
11present document.

- 12 • References are either specific (identified by date of publication, edition number, version number, etc.)  
13 or non-specific.
- 14 • For a specific reference, subsequent revisions do not apply.

15For a non-specific reference, the latest version applies

17[2] TIA-873-000: "All-IP Core Network Multimedia Domain; Overview"

## 183 Definitions, abbreviations and symbols

### 193.1 Definitions

20For the purposes of the present document, the following apply:

21**accounting:** process of apportioning charges between the Home Environment, Serving Network and User.

22**accounting information record:** record generated by a network element for the purpose of passing relevant  
23data or information to a centralized accounting function.

24**advice of charge:** real-time display of the network utilization charges incurred by the Mobile Station  
25The charges are displayed in the form of charging units. If a unit price is stored by the MS then the display  
26may also include the equivalent charge in the home currency.

27**billing:** function whereby records generated by the charging function are transformed into bills requiring  
28payment.

29**chargeable event:** activity utilizing telecommunications network infrastructure and related services for user  
30to user communication (e.g. a single call, a data communication session or a short message), or for user to  
31network communication (e.g. service profile administration), or for inter-network communication (e.g.  
32transferring calls, signalling, or short messages), or for mobility (e.g. roaming or inter-system handover),  
33which the network operator wants to charge for.

34**charged party:** user involved in a chargeable event who has to pay parts or the whole charges of the  
35chargeable event, or a third party paying the charges caused by one or all users involved in the chargeable  
36event, or a network operator.

37**charging:** function whereby information related to a chargeable event is formatted and transferred in order to

1make it possible to determine usage for which the charged party may be billed.

2**charging data:** data generated by a network element for the purpose of billing a subscriber for the provided  
3service. It includes data identifying the user, the session and the network elements as well as information on  
4the network resources and services used to support a subscriber session.

5**near real time:** near real time charging and billing information is to be generated, processed, and transported  
6to a desired conclusion in less than 1 minute.

7**rating:** The act of determining the cost of the service event.

8**real time:** real time charging and billing information is to be generated, processed, and transported to a  
9desired conclusion in less than 1 second.

10**settlement:** payment of amounts resulting from the accounting process.

## 113.2 Abbreviations

12For the purposes of the present document, the following abbreviations apply:

13	3G	3 <sup>rd</sup> Generation
14	AAA	Authentication, Authorization, and Accounting
15	AS	Application Server
16	BCF	Bearer Charging Function
17	BGCF	Breakout Gateway Control Function
18	BS	Billing System
19	CPCF	Content Provider Charging Function
20	CSCF	Call Session Control Function
21	ECF	Event Charging Function
22	ICID	IMS Charging ID
23	ICN	IP Connectivity Network
24	I-CSCF	Interrogating CSCF
25	IMS	IP Multimedia Subsystem
26	IP	Internet Protocol
27	MGCF	Media Gateway Control Function
28	MRFC	Media Resource Function Controller
29	MS	Mobile Station
30	OCS	Online Charging System
31	P-CSCF	Proxy CSCF
32	PDF	Policy Decision Function
33	PDSN	Packet Data Serving Node
34	PLMN	Public Land Mobile Network
35	SCCF	Subscriber Content Charging Function
36	SCF	Session Charging Function
37	S-CSCF	Serving CSCF
38	SDP	Session Description Protocol
39	SGW	Signaling Gateway
40	SIP	Session Initiation Protocol
41	TCID	Transport Charging ID
42	UE	User Equipment

## 433.3 Symbols

44For the purposes of the present document the following symbols apply:

45	Rb	Online Charging Reference Point between Session Charging Function and Correlation Function
46	Rc	Online Charging Reference Point between ECF and Correlation Function
47	Re	Online Charging Reference Point towards a Rating Server
48	Rf	Offline Charging Reference Point between an IMS Network Entity or an AS and AAA

1 Ro Online Charging Reference Point between an AS or MRFC and the ECF

## 24 Architecture

### 34.1 Charging Mechanisms

4The charging functionality is based on the IMS network nodes reporting accounting information upon  
5reception of various SIP methods or ISUP messages, as most of the accounting relevant information is  
6contained in these messages. This reporting is achieved by sending Diameter *Accounting Requests* (ACR)  
7[Start, Interim, Stop and Event] from the IMS nodes to the AAA and/or ECF.

#### 84.1.1 Off-line Charging

9For off-line charging the accounting information is gathered from various IMS network nodes where it may  
10be held for later forwarding to the Billing System. See Section 4.3.2 for further information.

#### 114.1.2 On-line Charging

12On-line charging interacts in real time or near real time with the service being provided by the system. The  
13subscriber's account is decremented in some units based on current usage of the system. Charging may be  
14based on events, time, or resource usage.

### 154.2 Logical Network and Charging Architecture

#### 164.2.1 IMS Architecture

17The overall IMS architecture is described in [2].

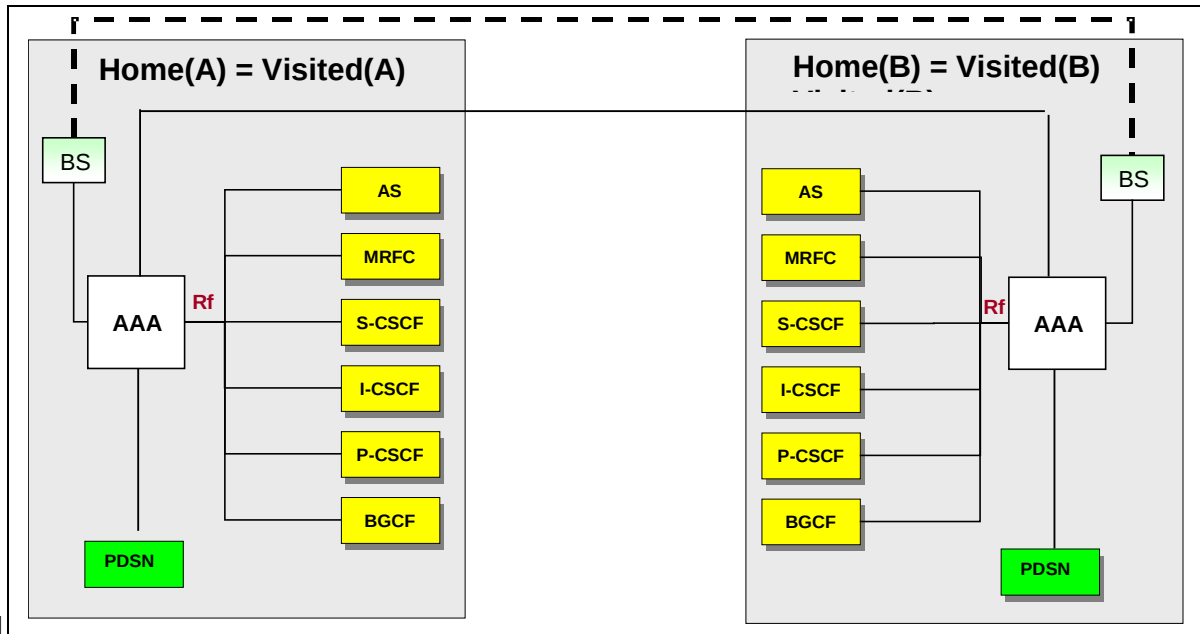

18

19

**Figure 4.1: Null**

#### 204.2.1.1 Architecture reference model for off-line charging

21Figure 4.2 presents the off-line IMS charging architecture for non-roaming scenario.

1

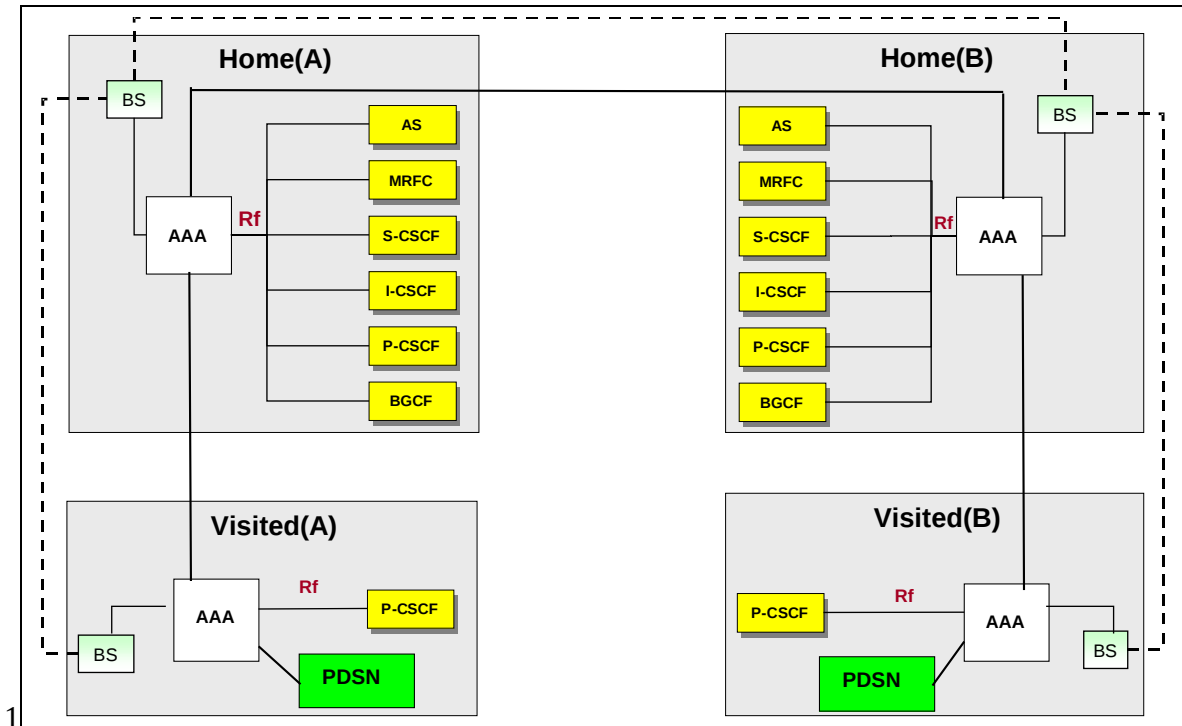

2 **Figure 4.2: Off-line IMS Charging architecture for non-roaming scenario**

3 NOTE: The topological merging of some of the lines representing the Rf reference points for  
 4 connecting with the AAA are performed for figure layout purposes only, and do not imply any  
 5 other logical or physical association.

6The interfaces between the PDSN and AAA and between AAA of User A's Home System and User B's  
 7Home System are outside the scope of this specification.

8Figure 4.3 presents the off-line IMS charging architecture for roaming scenario.

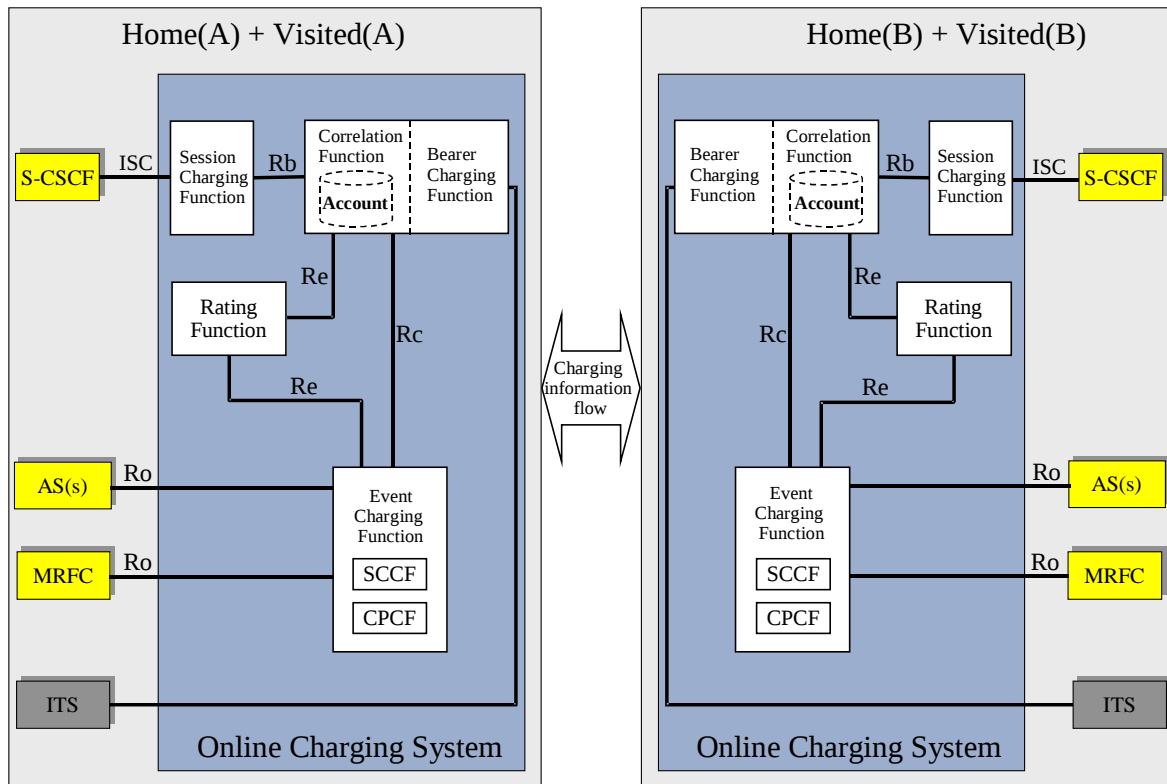

2 **Figure 4.3: Off-line IMS Charging architecture for roaming scenario**

3 NOTE 1: The topological merging of some of the lines representing the Rf reference points for  
 4 connecting with the AAA are performed for figure layout purposes only, and do not imply any  
 5 other logical or physical association.

6 In the off-line charging model operators have traditionally exchanged charging information between billing  
 7 systems as shown in the figure. Operators may desire to exchange charging information in near real time  
 8 utilizing the AAA infrastructure. In this case, the AAA in the visited network may pass information to the  
 9 AAA in the home network. The interface between the PDSN and AAA, those between billing systems and the  
 10 interfaces between AAA of User A's Home System and User B's Home System are outside the scope of this  
 11 specification.

#### 124.2.1.2 Architecture reference model for on-line charging

13 Figure 4.4 below presents the on-line IMS charging architecture.

1

2

**Figure 4.4: On-line IMS Charging architecture**

3Access Charging is performed using the appropriate IP Transport Subsystem charging interface to the Bearer  
4Charging Function. This may involve the use of AAA infrastructure to transfer information from the visited  
5network to the home network.

6Session Charging is performed using the ISC interface between the IMS Session Charging Function and the  
7S-CSCF. Routing to the Session Charging Function is performed as per regular ISC procedures.

8Event-based charging between an AS or MRFC and the Event Charging Function (ECF) is performed using  
9the Ro reference point. The Ro reference point is described in subclause 4.5.1. ECF address information is  
10distributed using SIP signalling such that Application Servers or MRFCs can use it to find the ECF.

11 Note: It is for further study as to whether the AAA can serve as the Event Charging Function.

12The Re reference point allows the interaction with a Rating server.

13The Rc reference point performs the following functions:

- 14 • The Event Charging Function can reach the Session Charging Function or the Bearer Charging  
15 Function via the Correlation Function.

- 16 • Correlation

- 17 • Access to the Account of the subscriber.

18The Rb reference point performs the following functions:

- 19 • . The Session Charging Function can reach the Event Charging Function or the Bearer Charging  
20 Function via the Correlation Function.

- 21 • Correlation

- 1 • Access to the Account of the subscriber.

2The SCCF and the CPCF, which are described in sub-clauses 4.3.4.1 and 4.3.4.2, constitute the ECF.

### 34.3 Charging Functions

#### 44.3.1 AAA

5The AAA main functionalities for IMS are that it provides the mechanism to transfer charging information  
6from the IMS nodes to the network operator's chosen Billing Systems(s). The main functions of the AAA are:

- 7 - the collection of Session charging information from the IMS nodes;  
8 - intermediate data storage buffering;  
9 - the transfer of the charging data to the billing systems.

10The AAA acts as storage buffer for near real-time charging data collection. It provides the charging data to  
11the billing system. This specification identifies the external interfaces of the AAA for accounting purposes,  
12but does not specify the internal functionality. However, some of the AAA functionality is described to  
13indicate its behavior. The AAA may perform specific activities, such as consolidation of data, pre-processing  
14of data fields, filtering of un-required data fields, and adding of Operator defined fields for specific billing  
15systems. These specific activities may be performed to optimize the charging information that is to be  
16forwarded to the Billing System, which should reduce the load in the Billing System.

17The AAA can receive data from the IMS nodes in near real-time mode. It should have enough storage to  
18enable it to transmit the collected charging data to the Billing System in file mode. The AAA may have to  
19support several transmission protocols towards the Billing System, depending on the Billing System(s) used.  
20One of the purposes of the AAA is to reduce the number of different interfaces between the Billing System  
21and the IMS nodes sending charging data. If a new Billing System is introduced it shall be interfaced to the  
22AAA, i.e. the protocol stacks and configurations of the IMS nodes do not need to be updated. The usage and  
23load of mass memory media can be more evenly distributed. The AAA may be distributed to several physical  
24nodes to facilitate redundancy.

#### 254.3.2 Session Charging Function (SCF)

26The Session Charging Function is responsible for Session Charging including the session control such as e.g.  
27session termination. Other functions such as the Correlation Function communicate with the Session  
28Charging Function via the Rb reference point.

#### 294.3.3 Bearer Charging Function (BCF)

30The Bearer Charging Function performs the Bearer Charging.

#### 314.3.4 Event Charging Function (ECF)

32The Event Charging Function (ECF) performs event-based charging (content charging). It makes use of the  
33rating function in order to determine the value of the service rendered. The ECF may correlate several event-  
34based charging requests. The ECF provides information via the Rc reference point that triggers the  
35Correlation Function to debit or credit the subscriber's account. Additional information sent by the ECF may  
36also be used in the Correlation Function to correlate Event Charging with Bearer Charging and Session  
37Charging.

38This specification addresses the following cases:

- 39 - the subscriber account, the ECF and the AS/MRFC (e.g. content server) are located in the same  
40 operator network.  
41 - the AS/MRFC are in a different operator network than the ECF and the subscriber account.

1However, the scenario where each of the content charging functions (SCCF and CPCF) is located in different  
2operator networks, and thus in different ECFs, is not addressed in this specification.

3*The SCCF and the CPCF, which are described below, constitute the ECF.*

#### 44.3.4.1 Subscriber Content Charging Function (SCCF)

5The **Subscriber Content Charging Function (SCCF)** is always located in the same operator network as the  
6account of the subscriber. The SCCF handles content charging requests that are made when the subscriber  
7accesses the content. Upon such a content charging request, the SCCF may for example request the  
8Correlation Function to check or to debit the subscriber's account. Content charging requests are received  
9from the Content Provider Charging Function (CPCF).

10In particular, the SCCF has the following responsibilities:

- 11 • to handle charging requests from the CPCF;
- 12 • to obtain the identity of the subscriber's account;
- 13 • to initiate a procedure to get a charging confirmation from the subscriber, if such a confirmation is  
14 needed;
- 15 • to request to debit or to credit a certain amount from/to the subscriber's.

#### 164.3.4.2 Content Provider Charging Function (CPCF)

17The **Content Provider Charging Function (CPCF)** manages the account that is maintained for the content  
18provider. Upon receipt of a charging request from the AS/MRFC, the CPCF processes the request and relays  
19it to the SCCF. The CPCF modifies the account of the content provider accordingly.

20In particular, the CPCF has the following responsibilities:

- 21 • to handle charging requests from the AS/MRFC.
- 22 • to interact with the SCCF that manages the communication with the subscriber's account. This  
23 interaction may include requests to the SCCF to charge or to credit the account of the subscriber.

24As it is not expected that every content provider has a business relationship with every IMS network operator,  
25the CPCF may be located in the operator network or in another network such as for example a Service  
26Provider network that supports the AS/MRFC. However, the second case (CPCF outside of the IMS network  
27operator domain) is not specified in this specification.

## 14.4 Charging Principles

### 24.4.1 Correlation of Charging Information

#### 34.4.1.1 Charging Correlation Levels

4The following levels of correlation for IMS charging shall be considered:

- 5 **1. Correlation within a session.** A session may comprise a number of media components. The IMS  
6 Charging ID may be used to correlate the charging data of the different media components belonging  
7 to a session.
- 8 **2. Correlation at media component level.** For a session comprising several media components (such as  
9 audio and video), charging data is generated for each media component and needs to be correlated  
10 between network elements. For this, a component identifier shall be unique and shall clearly identify  
11 to which media component of a session this charging information belongs to. This component  
12 identifier is not exchanged between network elements and is based on the ordering of media flows in  
13 the SDP. This ordering is the same as the one used in the binding information passed to the IP  
14 Connectivity Network.

15Correlation between the IMS and the ICN shall take into account the above described levels.

#### 164.4.1.2 Charging Correlation Capabilities

17To support the correlation of charging information, the following capabilities apply to both offline and online  
18charging:

- 19 1) The correlation of charging information for an IMS session is based on the use of IMS Charging  
20 Identifiers (ICIDs).
- 21 2) The first IMS network entity within the SIP signalling path is responsible for assigning an ICID. This  
22 ICID is then passed along the whole SIP signalling path in an end-to-end manner. However, this shall  
23 not preclude further elements (CSCFs) along the session path generating additional identifiers to be  
24 passed along. When the AS is the initiator of the session, the AS is responsible for assigning the ICID.
- 25 3) The ICID is passed to all IMS network entities in the SIP signalling path. This is performed using SIP  
26 signalling.
- 27 4) For the charging correlation between the ICN and the IMS, one or more Transport Charging IDs,  
28 which identify the channels of the session, may be passed from the ICN to the IMS. More specifically,  
29 these identifiers need to be transferred from the PDSN to the P-CSCF via the PDF.
- 30 5) The Transport Charging IDs (TCIDs) are passed by the P-CSCF to the S-CSCF and the AS using SIP  
31 signalling. Along with the ICID, the S-CSCF passes the TCIDs to on-line and off-line charging  
32 functions. The TCIDs are not transferred from one Home IMS (e.g. of the A-Party) to another Home  
33 IMS (e.g. the one of the B-Party).
- 34 6) The ICID applies for the duration of the event with which it is associated. For example, an ICID  
35 assigned for registration is valid for all registration-related charging procedures until a de-registration  
36 occurs, an ICID assigned for session establishment is valid until session termination, etc.
- 37 7) The charging correlation identifiers (ICIDs, TCIDs) will not be passed to the UE. They may however  
38 be passed to a content server connected as an endpoint.

39The charging correlation principles outlined above are applicable to other types of access networks. For  
40instance, it shall be possible to use instead of "Transport Charging ID" an equivalent term of the associated  
41access network.

1The detailed effects of certain complex scenarios (e.g. forking, multiparty sessions) to these charging  
2correlation principles are for further study.

### 34.5 **Implementation of Offline and Online Charging**

4The IMS charging architecture, described in this specification specifies that for offline charging all  
5communications between the IMS network entities and the AAA are carried out on the Rf interface. On the  
6other hand, for online charging the Ro interface is used by the AS and MRFC towards the Event Charging  
7Function and the ISC interface is used between the S-CSCF and the Session Charging Function. The rules  
8governing the selection of the proper interfaces are described in the subclauses below.

#### 94.5.1 **On-line charging reference point IMS Network Entity - ECF (Ro)**

10Event-based charging between an AS or MRFC and the ECF is performed using the Ro reference point. Ro is  
11an open interface which is standardized in [1]. The protocol for the Ro reference point is easily extendable to  
12include additional online charging functions. The Ro reference point supports integrity protection and  
13authentication for the case that the AS is outside the operator domain.

#### 144.5.2 **Usage of Rf and Ro Interfaces**

15The AS and MRFC are able to distinguish whether to apply offline or online charging, i.e. whether to send  
16charging information on the Rf interface to the AAA or on the Ro interface to the ECF (or to use both). The  
17decision of which interface to use is based on the information (AAA and/or ECF address) the AS/MRFC  
18receive in the SIP signaling and the system configuration as provisioned by the operator. If the AS/MRFC  
19only receive the AAA address and do not receive an ECF address then they use only the Rf interface. If only  
20the ECF address was provided then they use only the Ro interface. In cases where both AAA and ECF  
21addresses are provided it is possible to use both interfaces simultaneously.

22However, operators may overrule the addresses received via the SIP signalling and use their own configured  
23rules instead. Operators may configure locally on the AS/MRFC an ECF and/or AAA address. The AAA  
24address may be locally configured on all other IMS nodes. The choice of whether the IMS nodes use the  
25locally configured addresses or the addresses received by SIP signalling, and the decision on which  
26interface(s) to use, is left for operator configuration.

#### 274.5.3 **Usage of Rf and ISC Interfaces**

28All other IMS nodes (S-CSCF, P-CSCF, I-CSCF, BGCF and MGCF) apply offline charging via the Rf  
29interface using the AAA address as received via SIP signaling or the locally configured AAA address. The S-  
30CSCF supports online charging using the ISC interface, i.e. if the application server addressed over ISC is the  
31Session Charging Function of the OCS.
